

(a) Generative Agents

One Private Stream per Agent

The same event e is stored once per witness.

Recall scores recency $\times$ importance $\times$ relevance.

streams + a private reflection tree

(b) G-Memory

Two-Tier Graph, per Owner

Recall hits both tiers, then walks the edges.

A real graph — but never across owners.

(c) Collaborative

One Store, Partitioned by Permission

B may be granted access to A's copy —
but the copy remains.

sharing is a permission, not a merge

(d) Consensus (ours)

One Record, Several Owners

Recall returns the rows you own,
then walks one hop along the affiliation edges.

sharing is computed at deposit time
